1. Online Voting Project Website

Title:

Online Voting System Using Web Technology and Secure Authentication

Abstract / Introduction:

The online voting system is designed to provide a reliable and secure platform for conducting elections via the internet. This system eliminates the limitations of traditional voting methods such as long queues, paper waste, and human error. It integrates authentication mechanisms to ensure only legitimate users cast their votes while maintaining voter privacy and vote integrity.

Objectives:

- To design a user-friendly online voting platform.
- To implement authentication mechanisms (e.g., OTP, Aadhaar, or fingerprint).
- To ensure data security, privacy, and transparency in the voting process.
- To reduce election costs and improve efficiency.

Literature Review:

- Traditional voting systems face issues like rigging and booth capturing.
- Previous works explored blockchain-based voting for enhanced transparency.
- Cloud-based solutions (e.g., AWS EC2) enable scalability and accessibility.

Methodology:

1. Requirement analysis (Admin, Voter modules).
2. Design database for voter records and votes.
3. Implement secure login (multi-factor authentication).
4. Voting algorithm ensures one-vote-per-user.
5. Admin panel to view results in real-time.

Model / Algorithm Used:

SHA-256 Hashing Algorithm for password security.
or
OTP-based Authentication Model for voter validation.

Title:

Crime Investigation and Suspect Prediction System Using Data Mining

Abstract / Introduction:

This project provides a web platform for storing criminal records and applying predictive algorithms to identify suspects based on crime patterns, evidence, and prior records. It assists police departments in investigations.

Objectives:

- To maintain centralized criminal records.
- To apply predictive models for suspect identification.
- To support decision-making in on going investigations.

Literature Review:

- Data mining techniques have been applied to criminal profiling.
- AI and ML models improve accuracy in prediction.
- Previous works lacked integration with real-time web platforms.

Methodology:

1. Collect criminal database (cases, suspects, evidence).
2. Data preprocessing (normalize, categorize crimes).
3. Web-based dashboard for investigation officers.

Model / Algorithm Used:

Naïve Bayes Classifier for suspect prediction.
Decision Tree Algorithm for crime pattern analysis.

References:

IEEE journals on criminal data mining.
Research articles on predictive policing.
